Recent Research Attempts against the Emission Regulation

Recently...

More regulation on particle matter emission from diesel engine is gradually conducted

[Regulation on particulate matter emissions from diesel vehicles](#)

Emission reduction approaches

- Improving atomization and turbulent mixing
 - High pressure fuel injection
 - small orifice nozzle
- Combustion Method
 - HCCI
 - MK Combustion
 - Low temp. rich combustion
- Fuel modification
 - Oxgenated fuels
 - Biodiesel fuels
- Aftertreatment technologies
 - DPF

▼ Doshisha University – Energy Conversion Research Center & Spray and Combustion Science Laboratory –

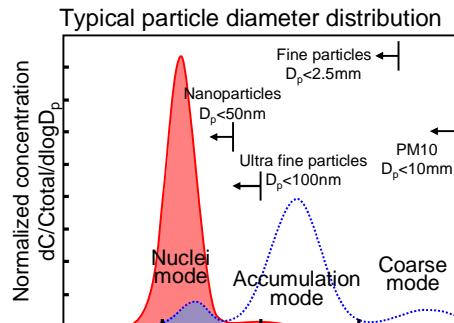

Back ground of this study

Nanoparticles ($d_p < 50\text{nm}$)
ex.) Soot, SOF

Serious health damage

- Lung cancer
- breathing problem

High number concentration
due to low mass concentration
Nanoparticles is unregulated

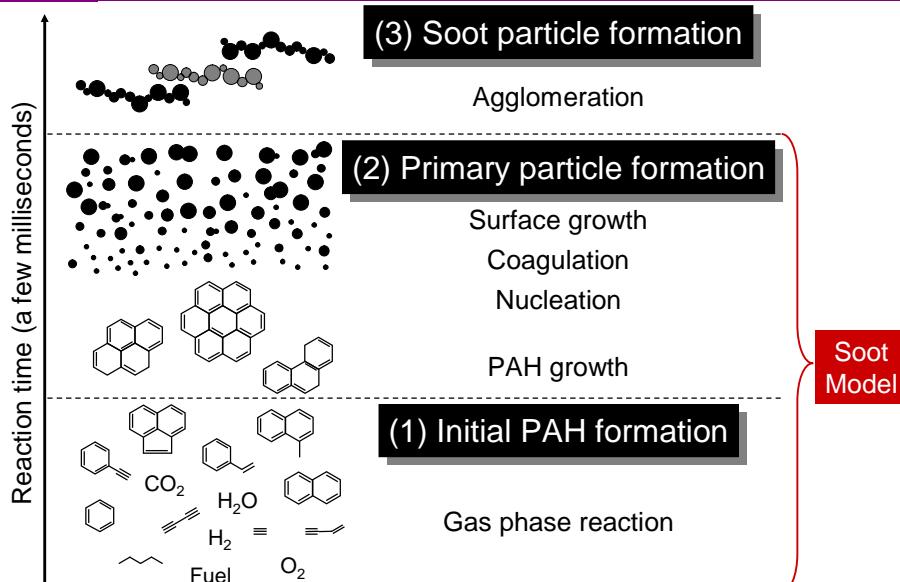

Objectives

- Investigate soot formation characteristic focused on soot volume fraction and particle diameter in diesel spray flame
- Investigate effects of various parameters on particulate characteristics

Chemical Role of Oxygenated Fuels on PAH Suppression

これまでの含酸素燃料の基礎解析によると、PAH生成およびその前駆物質であるC₂,C₃などの低級炭化水素生成の抑制特性として、燃料構造が影響する。

主要反応生成物が重要

アセチレン、エチレンなどの多環化物質は促進

アルデヒド類は抑制に働く

酸素原子に由来するOHラジカルによる酸化

→分子成長反応を抑制

アルデヒド類はHCOラジカルを介して水素原子を生成

→ベンゼン前駆体のプロハルキルラジカルの水素引き抜き

→ベンゼン生成を抑制

Effect of Fuel Type on PAH Formation

($p=10 \text{ MPa}$, $[C]=4.21\times 10^{19}\sim 1.26\times 10^{20} \text{ atoms/cm}^3$, reaction time: $t=3\text{ms}$, isometric pyrolysis reaction)

(a) PAH yield (1000 ~ 2400 K)

(b) PAH yield (bell peak temp.)

▼ Doshisha University – Energy Conversion Research Center & Spray and Combustion Science Laboratory –

Chemical Role of Molecular Oxygen and Oxygenate on PAH Suppression

* すす生成のベル型温度依存性

- ・低温域では熱分解による低級不飽和炭化水素の生成が遅れ、PAH抑制
- ・高温域では分子成長反応の逆反応であるPAHの分解可能が促進
→ギブス生成自由エネルギーの観点でも、1500K以上ではPAHよりアセチレンなどの低級不飽和炭化水素が安定

* ベル型分布のリーン側での低温側シフト(外部酸素)

- ・燃料の酸化反応の寄与度が増加し、初期に900K程度の低温でも酸化後の平衡温度が1600-1700Kに達する

* ティーゼル噴霧火炎内部でのすす生成の推定

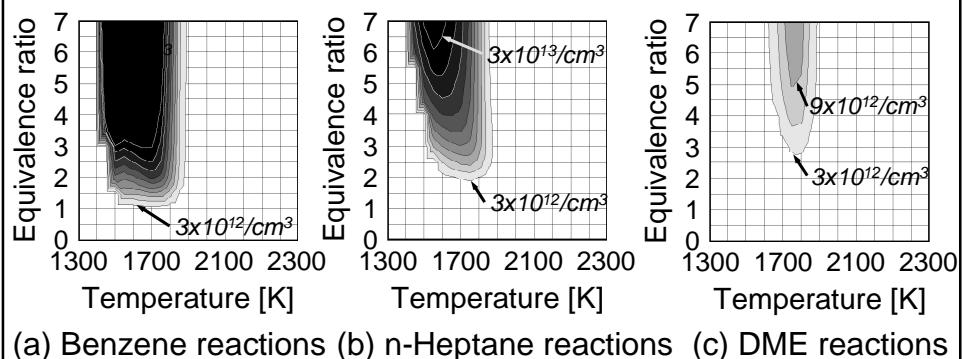

- ・低燃料噴射圧力条件: 低い空気導入率
→最大PAH生成温度域は1700K程度の高温
- ・噴霧外縁部の拡散火炎近傍ですす生成
- ・高燃料噴射圧力条件: 高い空気導入率
→噴霧内部の当量比4程度の希薄な領域で900-1000KでPAH最大生成
→噴霧中心部で活発なすす生成が生じる

Conclusions

詳細な0次元すす反応動力学モデルにより、粒子径・粒子数を考慮したすす生成の当量比-温度マップ解析および燃料組成がすす生成特性に及ぼす影響の検討を行ない、以下に示す知見を得た。

- すす体積分率のベルピーク温度よりも低温側では、小粒径・高数密度・高PAH濃度の粒子が、逆に高温側では、大粒径・低数密度・低PAH濃度の粒子が生成される。
- 上記に起因して、すす排出重量の低減に加え、微小すす粒子数および未燃PAH濃度を同時に低減するには、当量比-温度マップ上におけるすす生成半島の低温側より、燃料希薄側の利用が望まれる。
- すす生成の当量比-温度依存性は燃料成分の影響を強く受ける。特に、含酸素燃料では最大すす生成収率の大幅な低下やすす生成領域の大幅な縮小化が可能となる。

Turbulence chemistry interaction model

(Kong et al. SAE paper 2001-01-1026)

- Production rate of species i

$$\omega_i = \frac{Y_i^* - Y_i}{\tau_{kin,i} + f\tau_{turb}}$$

$\left. \begin{array}{l} Y_i : \text{current concentration} \\ Y_i^* : \text{equilibrium concentration} \\ \tau_{kin,i} : \text{kinetic timescale} \\ \tau_{turb} : \text{turbulent timescale} \sim k/\varepsilon \\ f : \text{delay coefficient} \end{array} \right\}$

$$\tau_{kin,i} = \frac{Y_i^* - Y_i}{\Delta Y_i} dt$$

* Assumptions

$$\left. \begin{array}{l} \tau_{kin,i} = \tau_{kin,fuel} \\ Y_f^* \rightarrow 0 \end{array} \right\} \rightarrow \left. \begin{array}{l} \tau_{kin} = (-Y_f / \Delta Y_f) dt \\ Y_i^* - Y_i = (-Y_f / \Delta Y_f) \Delta Y_i \end{array} \right\}$$

New species at the current time-step

- Kinetic controlled production rate of species i

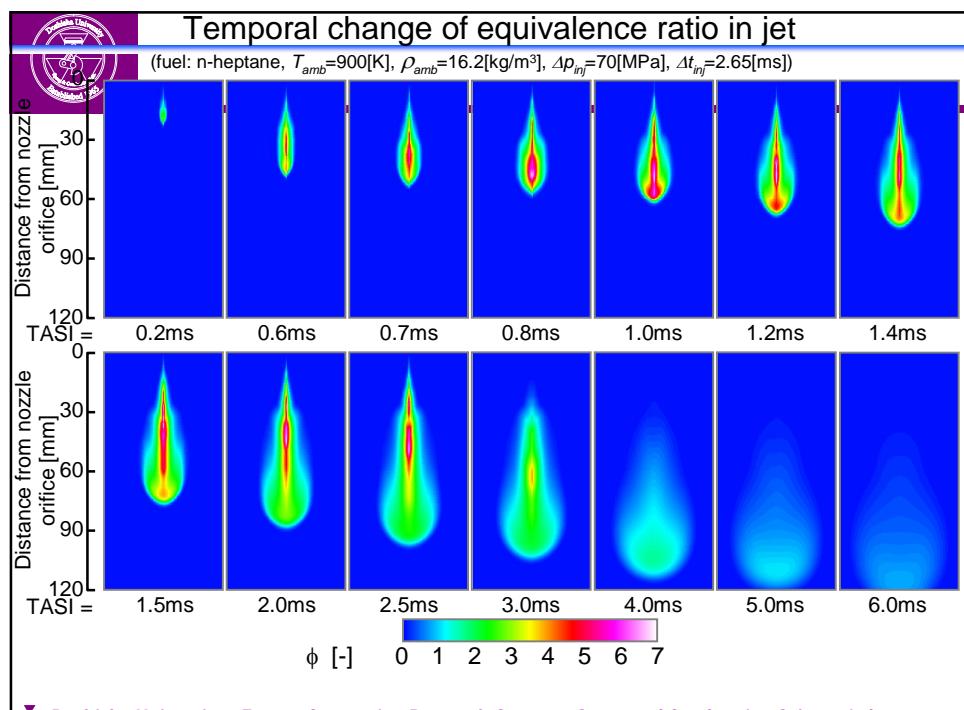

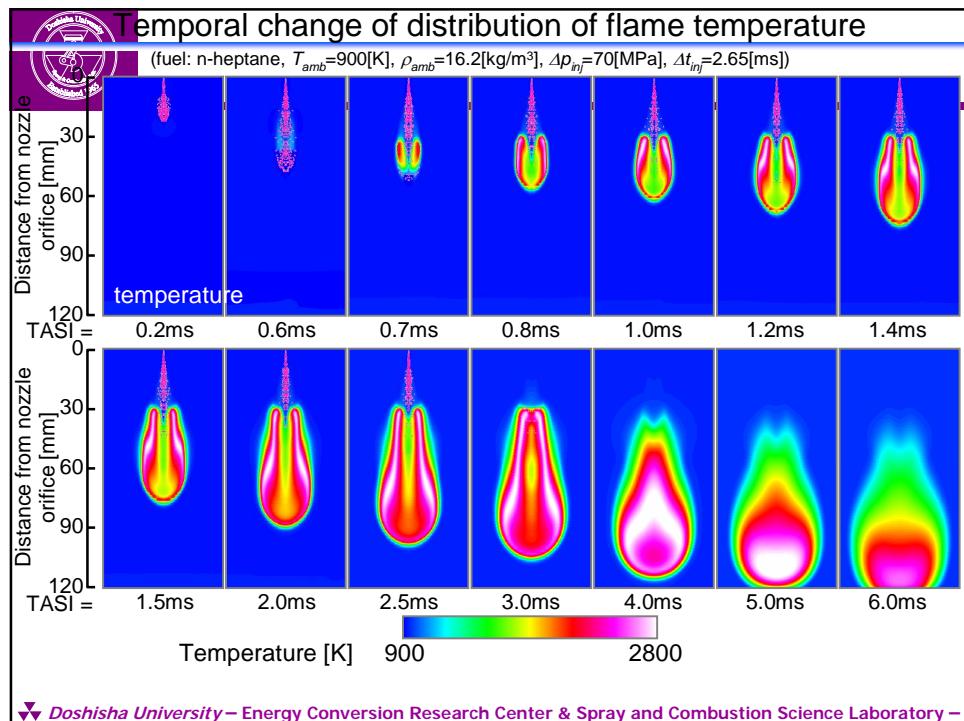

$$\omega_{kin,i} = \frac{Y_i^* - Y_i}{\tau_{kin,i}}$$

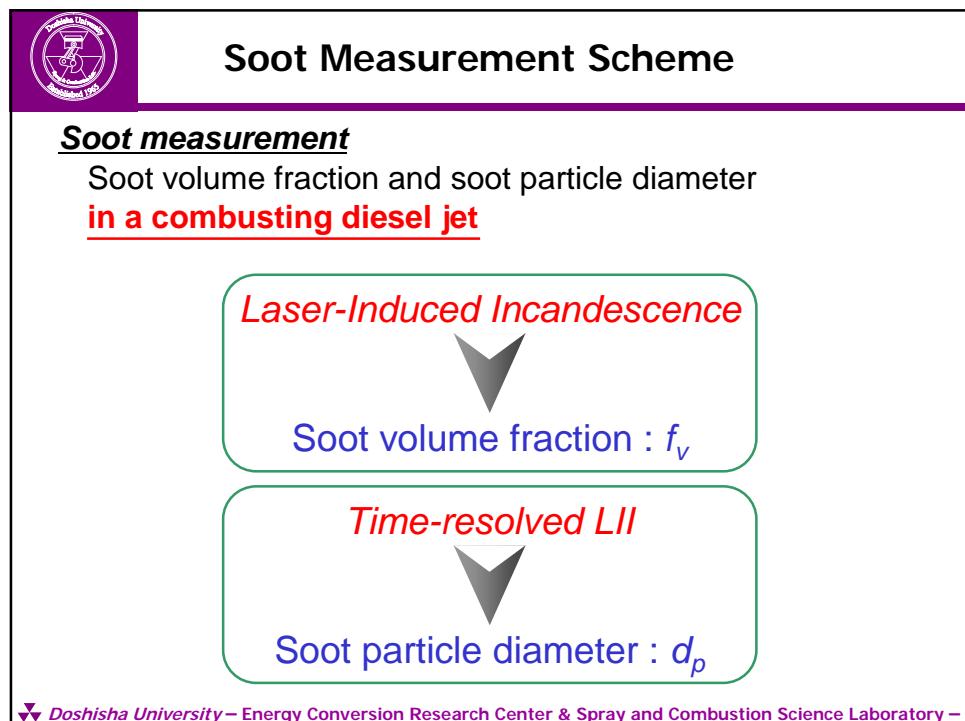

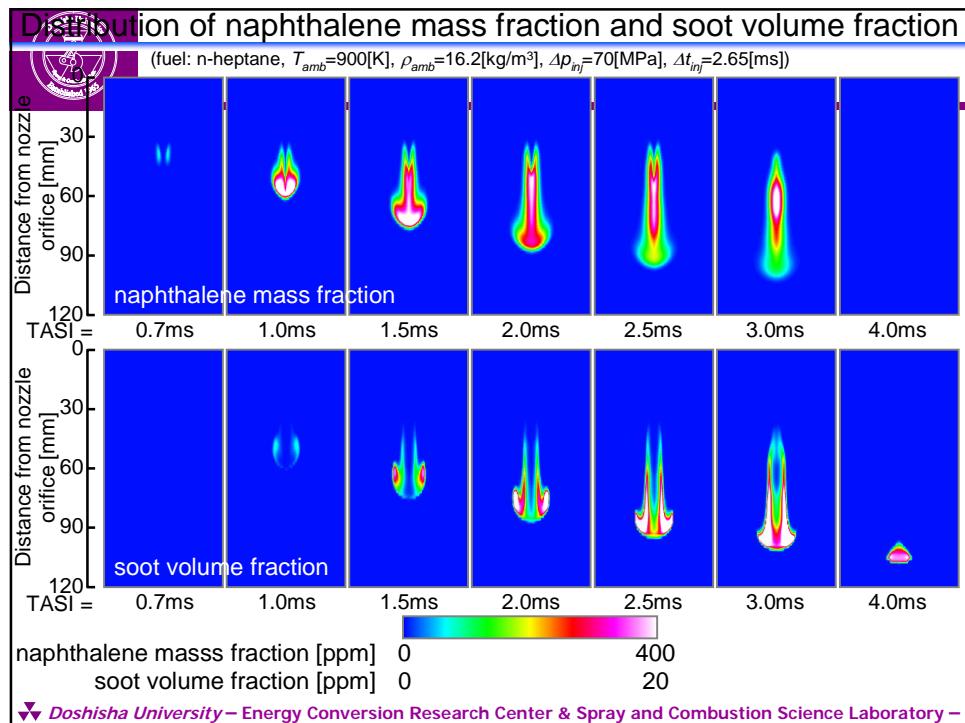

$$= \frac{Y_i - Y_i}{dt} = \frac{\Delta Y_i}{dt}$$

$\left. \begin{array}{l} Y_i : \text{current concentration} \\ Y_i' : \text{concentration after CHEMKIN cal.} \\ dt : \text{numerical time-step} \end{array} \right\}$

$$\begin{aligned} Y_i^{n+1} - Y_i^n &= \omega_i dt = \frac{(-Y_f / \Delta Y_f) \Delta Y_i}{\tau_{kin} + f\tau_{turb}} dt \\ &= \frac{\tau_{kin}}{\tau_{kin} + f\tau_{turb}} \Delta Y_i \end{aligned}$$

Principle of LII

Laser-Induced Incandescence (LII)

Soot particle temperature increases rapidly by high energy laser

- Soot incandescence (LII signal) irradiates
- Visualization of soot distribution

In addition, **LII signal intensity $\propto f_v$**

▼ Doshisha University – Energy Conversion Research Center & Spray and Combustion Science Laboratory –

Previous Study about Laser Induced Incandescence

■ A.C.Eckbreth

Fundamental properties of LII

- LII signal intensity increase with increasing laser power
- Decrease in soot diameter due to soot vaporization

■ L.A.Melton

Numerical analyze of LII

- LII signal intensity is proportional to soot volume fraction

$$F_v \propto N_p \cdot d_p^3$$

Application of LII to diesel engine

■ J.E.Dec

Advantage of LII for soot diagnostics

- Lack of scattering influence due to droplet or cylinder wall

▼ Doshisha University – Energy Conversion Research Center & Spray and Combustion Science Laboratory –

Theoretical Equations

$$Q_{abs} = \frac{8\pi a E_{(m)}}{\lambda}$$

$$q_{rad} = 4\pi a^2 \varepsilon \sigma (T^4 - T_{flame}^4)$$

LII signal (S_{LII})

$$S_{LII} = \frac{2\pi c_0^2 h}{\lambda_{em}^5 [\exp(hc_0/\lambda_{em} kT) - 1]} N_p 4\pi a^2 \varepsilon \Delta \lambda$$

At maximum temperature of soot particle (by Melton[#])

$$S_{LII} = N_p \cdot d_p^{3+154/\lambda_{em}} \approx N_p \cdot d_p^3 \propto f_v$$

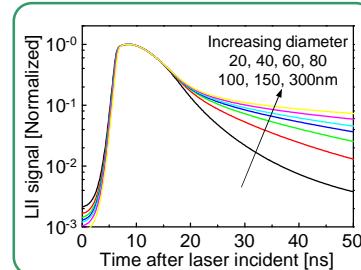

([#] L. A. Melton, APPLIED OPTICS, Vol.23, No.13, pp.2201-2208, 1984)

▼ Doshisha University – Energy Conversion Research Center & Spray and Combustion Science Laboratory –

Time-Resolved LII

- LII signal decay after laser incident depends on **particle diameter**.
- LII signal ratio at two different times also depends on **particle diameter**.
- Temporal change in LII signal decay after laser incident
(LII signal ratio at two different timing, etc)

Numerical simulation

as well as Melton's method

(L. A. Melton, APPLIED OPTICS, Vol.23, No.13, pp.2201-2208, 1984)

Conclusion

- すす生成開始直後は、生成領域の全域を10~20nm程度の小さな粒子が占め、拡散的燃焼期間への移行に伴い、噴霧外縁付近から大粒子へと成長する。
- 上流側で生成された小粒径のすすは下流に向かうに従い、凝集や表面反応により成長し、大粒子化する。
- 大粒子径のすすは噴霧外縁付近に多く分布し、噴霧中心軸付近は小さなすす粒子で占められる。
- 噴射圧力が増加するに従い、大粒子径のすすが生成し始める位置は下流へと遷移し、その時期は噴射時期後半へと移行する。
- 雰囲気酸素濃度の低下は、噴霧火炎内部で生成されるすす粒子の成長を抑制し、すすの小粒径化をもたらす。

Integrated LII intensity and characteristic particle diameter

▼ Doshisha University – Energy Conversion Research Center & Spray and Combustion Science Laboratory –

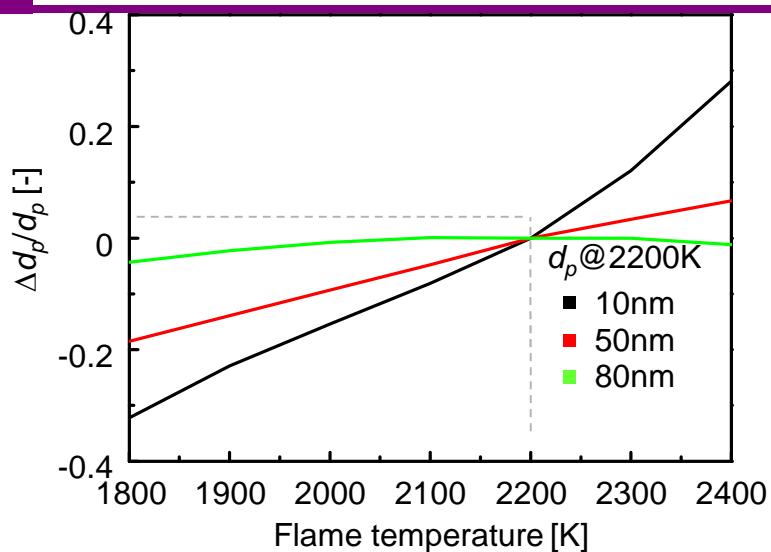

Conclusions

- (1) 予混合的燃焼期間の終盤に生成した微小なすす粒子は燃焼の進行とともに噴霧下流部へ拡がり、噴霧先端・外縁部で大粒子径のすすが高濃度で分布する。
- (2) 雰囲気温度の低下に伴い、大幅にすす濃度が減少し、粒子径もLIIシグナルが検出される全期間において微小となる。
- (3) 雰囲気酸素濃度が低下すると、噴霧火炎が肥大化することにより、すす生成領域が拡大する。また、雰囲気酸素濃度の低下に伴い、すす粒子の生成・成長が緩慢となることで、粒子径およびすす濃度はともに減少する。
